

# Technical Considerations

## Transport

The delivery route for the turbine components is expected to be via the A77 from one of the local ports.

There will be some requirement for alteration of street furniture and upgrade of the A77 junction at Shalloch Mill.

## Construction

It is anticipated that once construction begins it will be completed in approximately 6-9 months.

Materials for the construction of access tracks and hardstandings are expected to be won on-site. Concrete for the turbine foundations is also likely to be batched on site. This will help minimize vehicle movements on public roads.

## Grid Connection

GreenPower are currently in detailed discussions with Scottish Power Energy Networks and National Grid. Information on the nature and route of the grid connection will be made available when these discussions have been concluded.
